The big difference between Arrhenius acids and bases and Brønsted-Lowry acids and bases is that Arrhenius acids describe what a compound is, while Brønsted-Lowry describes what a compound does. As a result, when you put two compounds in a beaker, whatever compound acts as an acid in this case will give one or more H⁺ ion to the base.

Naming acids that don't have oxygen in them. If acids don't have oxygen in them, the general format for writing them is this: hydro[something]ic acid. In this case, the [something] refers to whatever the anion is after the H. For example, H₂S, is named "hydrosulfuric acid" because the [something] in this case is sulfur.

Brønsted-Lowry definition explains acids and bases in terms of electron pairs. Arrhenius defined bases as containing OH⁻ and Brønsted-Lowry said that bases have H⁺. Arrhenius defined bases as containing OH⁻ and Brønsted-Lowry said that bases are proton acceptors. They are the same definition, just different names.

•Brønsted-Lowry acids and bases: Acids give off H⁺ ions while bases absorb them. o This is practically the same definition (acids are exactly the same and it's clear that something with OH⁻ ions will grab H⁺ ions to form water) - the reason it was invented was to account for the fact that NH₃ is a base when you put it in water (it reacts with water to form NH₄OH, which is where the OH⁻ comes from).

Acid and Base Packet #1 - Honors Chemistry

Acids and bases can be defined by their physical and chemical observations (Table 16.1. 1). Acids and bases in aqueous solutions will conduct electricity because they contain dissolved ions. Therefore, acids and bases are electrolytes. Strong acids and bases will be strong electrolytes.
